2: Durham B-5 (ca. 1910)1928 EG1 Albania EG1

562 592 [583] a daughter and no son she has the right to remain a hundred days in the house. Then if the heirs order her to leave she must go, but her daughter remains as part of the heir's household, and he has the right to choose her husband and dispose of her. In practice the widow may 587 remain in the house as "levirate wife" of one of her brothers-in-law, and very commonly does so among the Dukagini. In Maltsia e Madhe the practice is obsolete.

589 562 If the widow has had a son who has predeceased his father, she has more consideration. If the house is a small one, she may live in it if capable of carrying on. If a large one, she may live as a member of the heir's household so long as she is unmarried. If she elects to return [593] to her father, the heir, or heirs, must supply her regularly with wool for spinning, bread, cheese, and other necessaries so long as she remains unmarried.

421 A married daughter has no right to anything whatever of her father's property; she no longer belongs to his "house."

TRIBAL BUSINESS

623 Business relating to the whole tribe requires a very large council. In a large tribe the council may be about a hundred. It includes the heads of houses, the heads of mehalas, the bariaktar, and twelve specially chosen elders famed for their intelligence. Such a council, for example, was needed to decide if each tribe would accept the Turkish Constitution in 1908; to decide if a tribe would revolt or aid another that has revolted; what side it would take in war, and so forth. Smaller councils dealt with pasture lands; how many beasts each house might pasture upon the common lands; the date at which pasturing might begin.

421 The rights of wood-cutting, too, were thus regulated. Certain groups 311 had rights in certain woods. Unluckily no one ever thought of replanting. Great harm has been done by deciding to burn a forest in the [134] hope of obtaining pasture land; only too often the result being that the winter rain carried away the soil and left bare rock. The water 312 supply is also controlled by council, especially in those districts where an ingenious system of channels carries water great distances and takes it across valleys on rude aqueducts made of hollowed tree-stems. 689 In time of scarcity the number of hours per week in which a man may turn the water into his fields is jealously regulated. Purposely defiling wells and springs was punishable.

671 Not only all the above laws are ascribed to Lek, but many rules intended to keep the peace. For example, that men marching abreast must keep the length of a gun-barrel apart, lest in turning hastily it

cries of the street vendors. The nights, even during the summer, are delightfully cool and enjoyable; sitting in one of the comfortable café gardens of Tirana with a cup of delicious coffee! The old saying of "being killed with kindness" is literally true in this unique kingdom.

Upon leaving Tirana, the capital of Albania, and journeying further into the heart of the country, one comes more in contact with the native aspect of this country in all of its charm. The land, in the vicinity of Tirana, is smooth and devoted to wide, rich fields of maize and wheat. A few miles further on the landscape loses its cultivated appearance and the scenery becomes more wild and desolate, and at the same time extraordinarily beautiful. From plains the country rapidly rises into rolling hills and rugged rocky mountains, and becomes a country from Wonderland.

The first point of interest along this route are the ruins of the Petrela Castle, which dominated this district until the rise of Tirana about 1600. However, fragments of tile proclaim the fact that it was built for fortifying purposes in ancient times, but the more evident pro-Turkish brick and stone mortar de-

summits are clad in eternal snows, but at lower elevations stretch vast forests of pine and other trees, and rich pasturages on which the sheep and cattle of the Ghegs roam in summer. The land is cultivated to any considerable extent only in the south, where the climate is more suited to the production of crops, and the character of the people to the pursuit of agriculture.

Albania is divided into two *vilayets*, or provinces, called after the names of their chief towns, Scutari and Ioannina, the residences of the Ottoman Governors. The former, which is also called Northern Albania, is inhabited chiefly by the Ghegs and Miridites, and the latter by the Tosks, Khams, and Liaps, all of whom, however, are proud to call themselves by the national name of Skipetar.

Though nominally brought under the Turkish yoke and partially converted to Islam in the fifteenth century, after an heroic struggle of twenty-five years' duration under the famous Skanderbeg,[1] the Albanians long maintained a sort of semi-independence. As Moslems, they fought under their own leaders in the armies of the Sultans, who esteemed them among their bravest soldiers, and rewarded their services with numerous privileges and grants of property. The warlike Albanians were consequently never in spirit a conquered race, and the old feudal social system, which they were still able to maintain, aided by the nature of their country, made it occasionally possible for the chieftains to throw off, for a time at least, the authority of the Sublime Porte. The most

northern mountains begins modestly with ranges 2000–2600 feet above sea-level, surpasses 7000 feet in several peaks of Lower Shalë, and culminates in the Accursed Alps (*Bjeshkët ë Nemuna*), where the close-set summits of Radohinë (8690 feet), Jezercë (8790 feet), Rosh (8270 feet) and Kolatë (8370 feet) wall off Yugoslavia from Upper Shalë in spectacular fashion. East of Shalë, the monster Peak of the Irons (*Majë e Hekuravë*, 8530 feet) divides the tribe of Mertur from the open plateau of Krasniqë. The passes across the mountains are often lofty and arduous. To take an extreme example, the only way from Shalë to Bogë, its western neighbour, is by the Sheep Track Pass, to the northern frontier by the Pejë Pass, and to Nikaj on the east by the Ndermajnë Pass, which are respectively 5900, 5600 and again 5600 feet above sea-level and take a day to traverse. It is self-evident that the tribesmen of Shalë have never seen much of their neighbours. Elsewhere geographical conditions are less formidable, yet generally severe enough to limit intercourse between communities.

It is clear that agriculture and permanent habitations must stop far below the summits of many mountains, and that on the highest slopes there can be only summer grazing. Throughout the area as a whole, however, there is so much summer and winter grazing that many Albanians live entirely by pastoralism and many others combine it with their agriculture. In this connexion it is essential to remember the part played by the immense forests. These spread over the grim mountains as well as the plains, saving Albania from the desiccated look of Dalmatia and Greece, and making its scenery agreeable to the eye at all seasons. The forest trees are of many kinds, with a large proportion of evergreens. Since they grow at different levels according to their kinds, three zones, named the shrub, oak and beech, or pine zones after their predominating tree, have been distinguished.[1]

Shrubs grow all over the plains near the coast and up to a height of 600 feet in exposed regions like Shkodër and Durrës and 1600 feet in sheltered spots like the gullies on Mt Dajt. They include tree heather, hornbeam, arbutus, wild olives, broom and the terrible Christ's Thorn (*Spina Cristi*), which, withered or green, tears the flesh so savagely with its spikes that it is popularly said all over the Near East to have been used for the Crown of Thorns. There is rough winter grazing among the shrubs, especially for

10:Hasluck F-5 (1926-1939)1954 EGl Albania EGl

There is rough winter grazing among the shrubs especially for
goats and cattle, and some agriculture in clearings, but the zone derives its chief riches from the many acres of fertile alluvial soil that adjoin the rivers.

Oaks, tall or dwarf, begin sporadically among the shrubs and continue as thick forests up to a height of 2900 feet near Shkodër and 3300 feet in warmer districts. Among them grow ash, aspen, chestnut, cornel, elm, hawthorn, hazel, hornbeam and limes. The majority of the 1140 villages in north Albania are found in this zone, for it best provides for Albanian needs. Though the soil is dry on the whole, it contains a sufficiency of springs. On the plateaux and gentler slopes there is enough arable land for subsistence farming, all that is possible among these rugged mountains. The copses and woods furnish winter grazing for small flocks and herds; an adjoining mountain furnishes the requisite summer feed. The copses and woods also provide fuel for the log-fires that in Albanian phraseology are 'the poor man's wealth'. Leaves lopped from the oak trees in autumn supply winter fodder which livestock eat with almost as much relish as they do hay, a scarcer commodity. It is this supplement to the grazing in the copses and woods which makes mixed farming possible in this zone; without it many animals could not get through the winter, and their number would have to be reduced. If it is sometimes hot in the forest in summer, the heat is never unbearable, and in winter the cold is never excessive. In general the zone is healthy. A little wheat is grown, but—as everywhere in Albania, the Myzeqe plain excepted—the staple crop is maize. The grain provides food, and the livestock luxuries and government dues as well.

In the next zone beeches grow singly, in small clumps, or in mighty forests such as those between Çermenikë and Martanesh where one may walk for seven hours in the daytime and never catch a glimpse of the sun. Still without roads to carry modern woodcutters and their tools to them, such forests are in the virgin state, the trees self-sown, the strong killing the weak, and the survivors growing bigger and bigger until they succumb in extreme old age to some winter blast, when they lie and rot where they fall. When communications are developed, this waste will stop and these forests become a very valuable asset. No grass grows in them or under isolated beeches, of course, but there are usually grass meadows in the clearings, some of which are enormous. Well watered from the same sources as the beeches and fat with humus

10: Hasluck F-5 (1926-1939)1954 EGl Albania EGl

from decaying beech leaves, these meadows make magnificent grazing in summer.

Where the underlying rock is serpentine, the forests in this zone are of pitch pine, not beech. Following the rock formation the pines may continue above the beech limit as on Mt Munellë in Mirditë, Mt Nezhdë, and the Peak of the Irons in Shalë. Or they may grow as low as the oak zone, adding to its amenities with their timber and pastures. In certain districts they cover whole mountain sides, while beeches fill the intervening, moister valleys; for beeches like a damp soil, and pines a dryish. Whether among the trees or in the clearings, these forests are a paradise for animals. They have other values, too. Their lower reaches are accessible enough for the peasants to cut their timber, load it on ponies, or slide it down the mountain side to their villages, there to be used for building or other simple purposes. Pine slivers are the only form of lighting in many village houses, and they also bring in a little money, finding a ready sale in towns as kindling for fires.

The pine and beech zone is mostly too high for winter use. Near the coast its tree-limit is 5200–5600 feet above sea-level. Farther inland, where one range shelters another and the soil is damper, it may be 6000 feet, as on Mt Bukanik in Shpat or Mts Munellë and Nezhdë. On Mt Gjalicë it is 7000 feet. Between the tree-limit and the summits of higher mountains there is nothing but rock, scree and treeless pastures.

This pine zone is as necessary to Albanian economy as the oak zone. On much of the treeless ground above it the grass is so coarse that sheep will not eat it at all, and horses nibble it only at the beginning of the summer season and then with distaste. The grass of the pine and beech zone is sweet and palatable even to dainty sheep throughout the summer. On the agricultural side the zone serves as a great catchment area, not only for the huge, unharnessed rivers that traverse north Albania, but also for the myriads of invaluable little streams that flow down to the agricultural districts in the oak zone. Without these streams there could be little irrigation; without irrigation there could be little agriculture. Maize must have water, and there is never enough rain in summer to supply it.

In the two areas of summer pasturage, the beech and pine zone and the treeless slopes above it, many thousands of cattle, horses, goats, and especially sheep, graze from May to October. Their

A Railway Line

As no-one but myself wanted to go on to Tirana I was put with the mails into an ordinary four-seater Ford car and continued the journey alone save for the driver. The country was well wooded with oak, ash, poplar, willow and alder. The fields were enclosed with hedges of bramble and, but for the big wild fig-trees, I might almost have been in England. I had been told that I should find in Albania no bank, no water-closet, and no railway, but as regards the railway I found this statement incorrect, for a narrow gauge track ran at the side of the road most of the way from Scutari to Tirana. It did not, however, appear to have been used for a considerable time as it was in bad repair and much broken. At one place, half-a-dozen little locomotives, dismantled and red with rust, stood idle on a siding, while in a ditch a short distance away lay a seventh—a pathetic corpse in a winding-sheet of bramble and convolvulus. Presumably the line was wrecked by the Austrians when they were in retreat at the end of the war. I should not imagine that it would be a very costly matter to put it into working order again.

The impression I received in the course of this drive was that the surrounding country was exceedingly fertile, and that much which is at present uncultivated could be made productive if modern agricultural methods were adopted. In all countries the farmer and tiller of the soil—conservative to the backbone—is slow to admit that his way of doing things can be bettered, and to this general rule the Albanian agriculturist is no exception. He knows nothing, and wants
